Wireless Communications

- Introduction
- Cordless Telephones
- PMR (Professional/Private Mobile Radio)
- Radio Paging
- Microwave Relay Systems
- Satellite Communications
- Bluetooth
- WLAN
- Cellular Communications

Komunikasi Nirkabel
(Wireless Communication)

- **Sistem komunikasi nirkabel** atau **nirkawat *(wireless communication)*** adalah sistem komunikasi yang media transmisinya berupa non-fisik (**tanpa kabel/kawat**).
- Transmisinya menggunakan **gelombang elektromagnetik**.
- Terminologi **komunikasi nirkabel (*wireless communication*)** adalah pengganti terminologi **komunikasi radio (*radio communication*)**.
- ***Mobile communication*** adalah sistem komunikasi yg bersifat nirkabel dan memungkinkan pengguna *(user)* dpt **berkomunikasi sambil bergerak**.

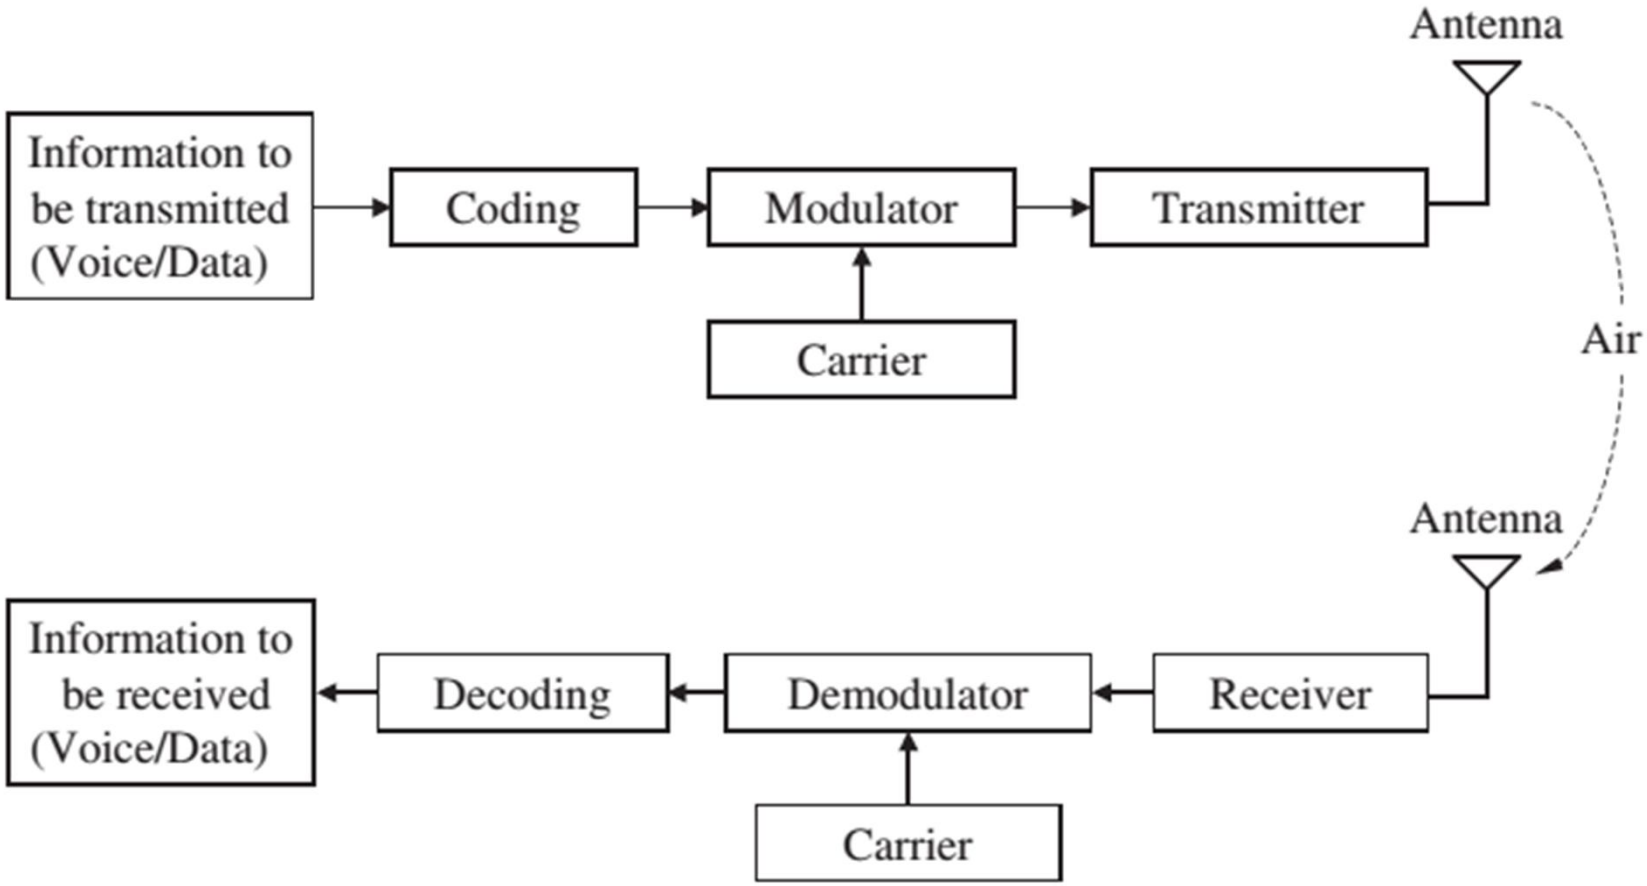
Komunikasi Nirkabel (2)

- Secara umum ***mobile*** diidentikkan dgn ***wireless***, sehingga istilah ***mobile communication*** sering dipertukarkan dgn ***wireless communication***.
- Meskipun sebenarnya ***wireless communication*** mencakup ***fixed wireless communication*** dan ***mobile wireless communication***.
- Oleh karena sistem komunikasi bergerak yg paling dominan adalah sistem komunikasi seluler, maka ***mobile communication*** sering juga diidentikkan dengan ***cellular communication***.
- Padahal sebenarnya sistem komunikasi bergerak tdk hanya berupa sistem komunikasi seluler.

Klasifikasi Komunikasi Nirkabel

Wireless Communication	**Fixed Wireless**	**Non Cellular**	**contoh :** point to point communication, infra red communication, LMDS, Microwave communication
		Cellular	**contoh :** PHS, CT2, PACS, DCS1800, DECT
	Mobile Wireless	**Non Cellular**	**contoh :** paging system (ERMES, NTT, NEC) , dispatching system, PAMR (*Public Access Mobile Radio*) dsb
		Cellular	**contoh :** GSM, CDMA/IS-95, AMPS, UMTS, PHS, DCS1800, NMT450, TACS, C-450, dsb

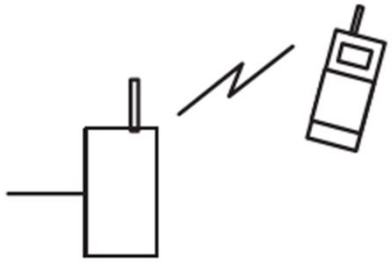
Sistem Komunikasi Nirkabel
(disederhanakan)



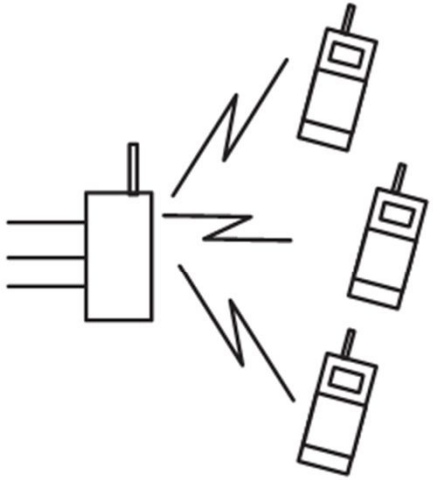
Wireless Communications

- Introduction
- **Cordless Telephones**
- PMR (Professional/Private Mobile Radio)
- Radio Paging
- Microwave Relay Systems
- Satellite Communications
- Bluetooth
- WLAN
- Cellular Communications

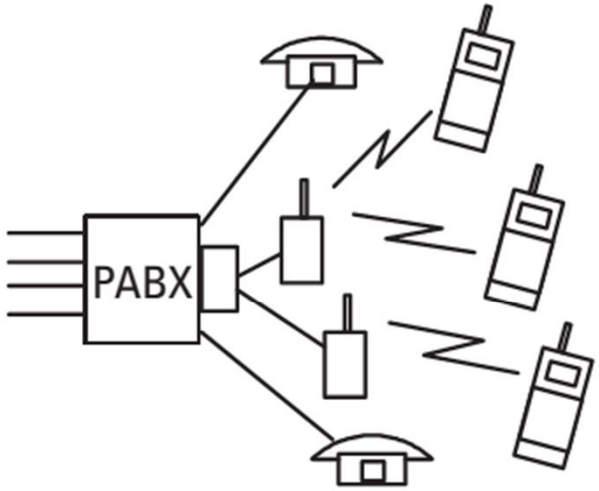
Cordless Telephones



Residential use



Telepoint or wireless
local loop, WLL



Cordless corporate network

Aplikasi Cordless Telephones

- Residential Use
  - First generation cordless phones (CT1)
  - Cakupan hanya seluas rumah dan halaman.
- Telepoint dan Wireless local loop (WLL)
  - Second generation cordless telephone technology (CT2)
  - Misalnya pada stasiun kereta dan bandara.
  - Pemakaiannya berkurang dgn semakin murahnya biaya telepon seluler.
- Cordless Corporate Network
  - Digital European Telecommunications (DECT).
  - Personal access communication system (PACS) di Amerika.

Wireless Communications

- Introduction
- Cordless Telephones
- **PMR (Professional/Private Mobile Radio)**
- Radio Paging
- Microwave Relay Systems
- Satellite Communications
- Bluetooth
- WLAN
- Cellular Communications

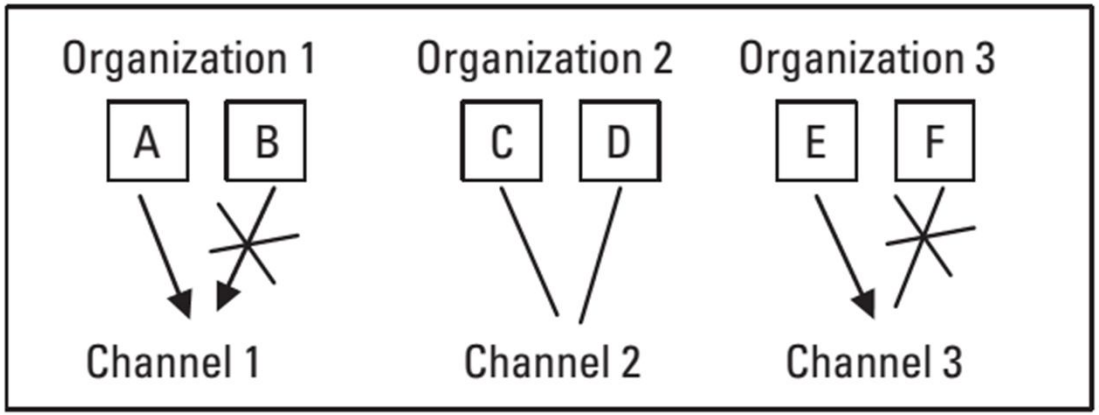
PMR

(Professional or Private Mobile Radio)

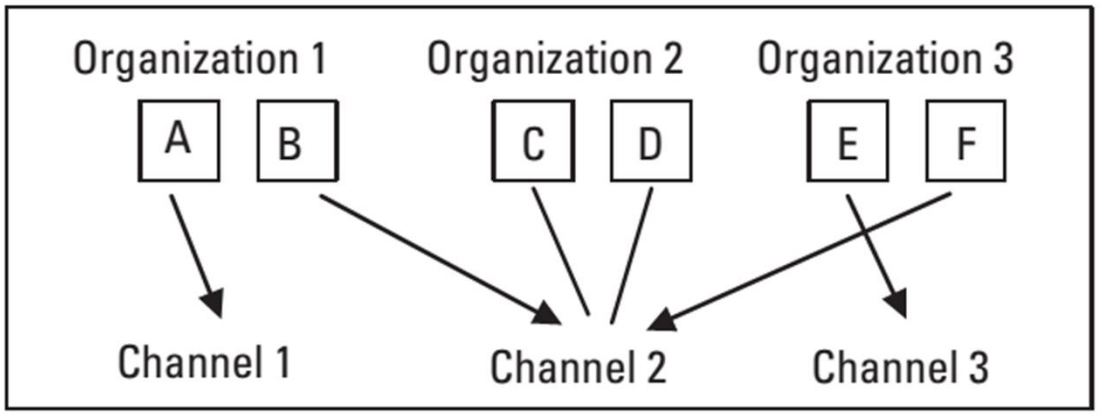
- The PMR systems are dedicated and independent mobile radio systems.
- Some of them are just simple “walkie-talkie” type radios, others are complex networks that use a technology similar to that of public cellular mobile radio systems.
- One typical PMR is owned by a taxi operator.
- Standar PMR digital modern: Terrestrial Trunked Radio (TETRA).

Resource sharing dan Trunked network pada PMR

Conventional PMR (dispatch) network:
One channel for each organization



Trunked network:
Radio channels (spectrum) are shared by all users who may belong to separate networks



Wireless Communications

- Introductions
- Cordless Telephones
- PMR (Professional/Private Mobile Radio)
- **Radio Paging**
- Microwave Relay Systems
- Satellite Communications
- Bluetooth
- WLANs
- Cellular Communications

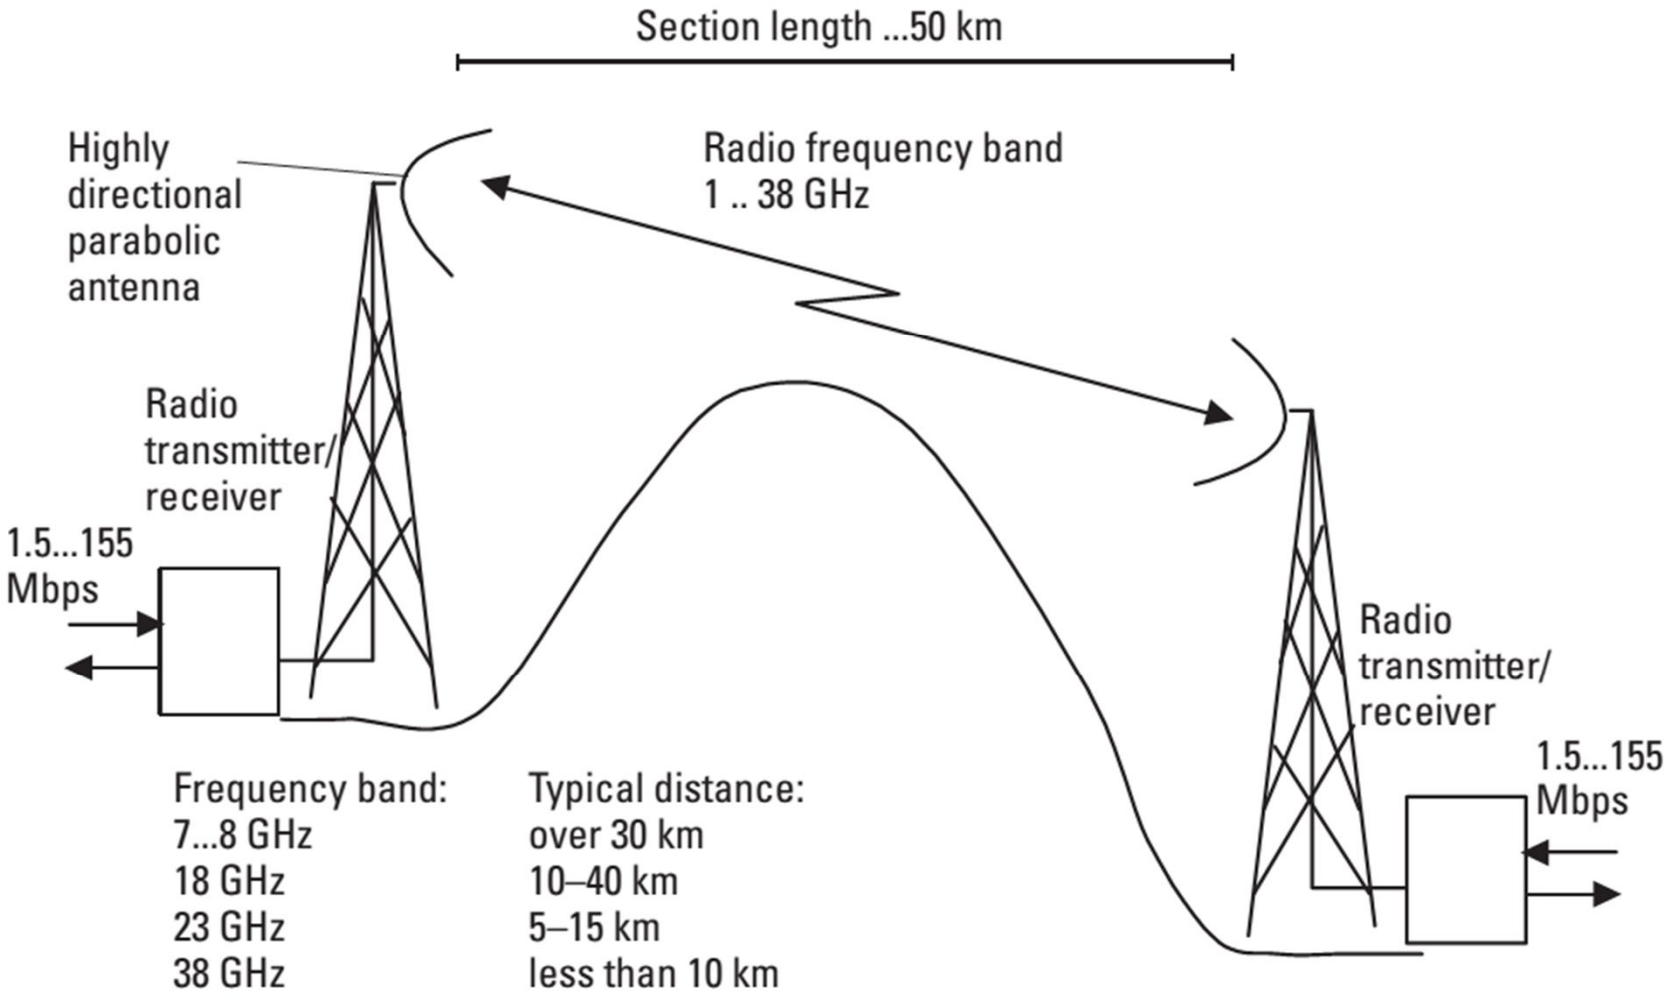
Paging Networks

- Paging networks merupakan komunikasi unidirectional saja.
- Pager merupakan sistem komunikasi wireless (nirkabel/nirkawat) yg low-cost.
- Pager sederhana hanya dpt menyampaikan “beep”, tetapi yg lbh maju dpt menyampaikan pesan (message) yg cukup panjang.
- Keberadaannya telah dikalahkan oleh munculnya sistem selular.

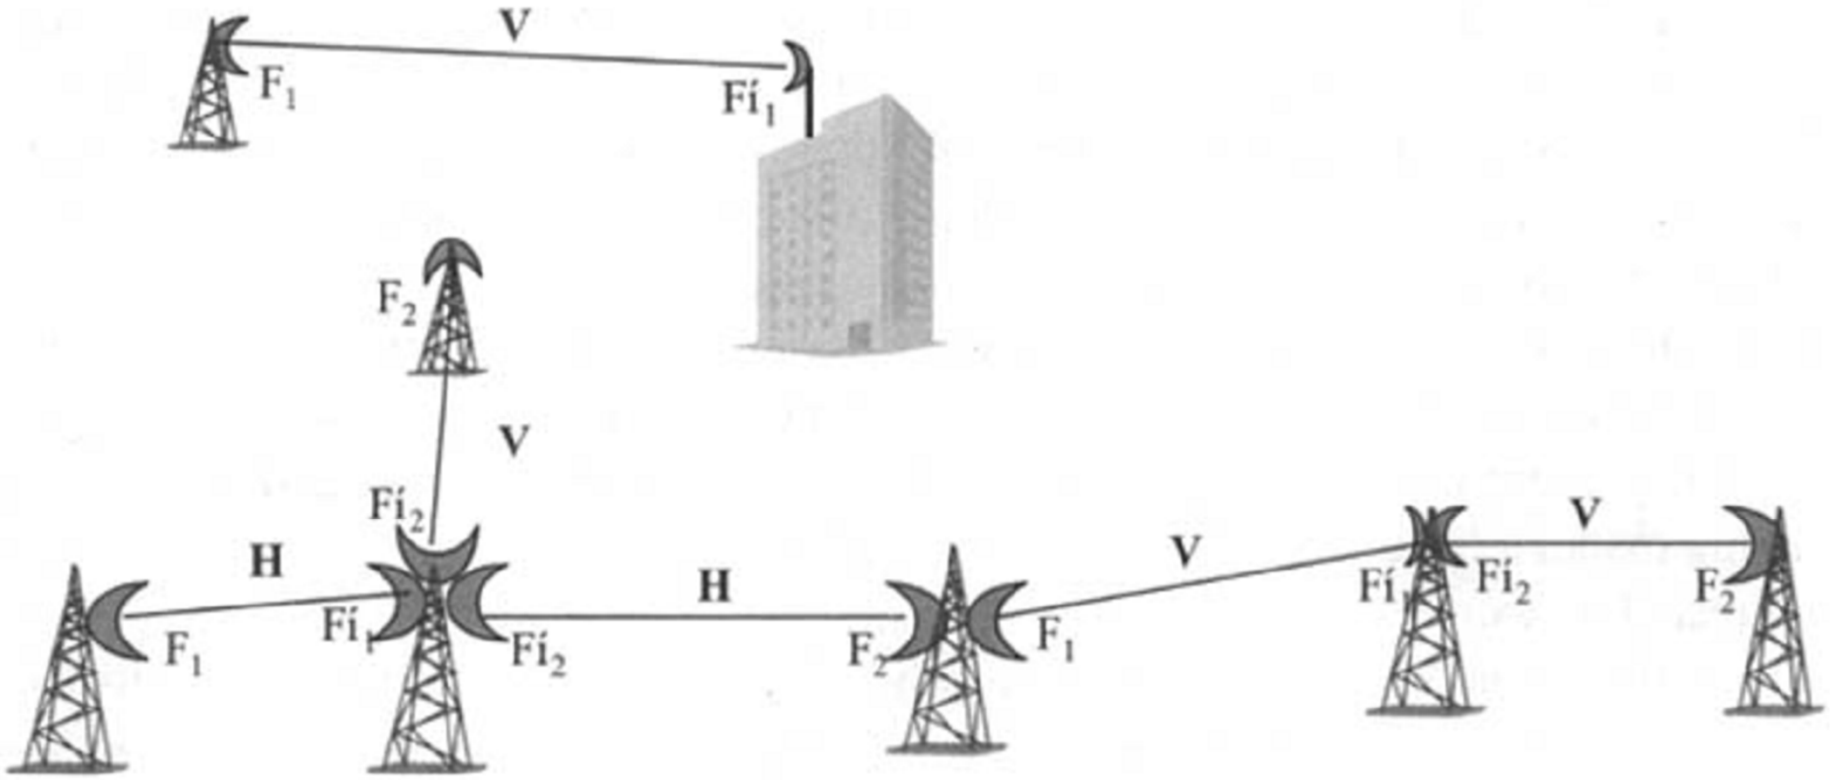
Wireless Communications

- Introductions
- Cordless Telephones
- PMR (Professional/Private Mobile Radio)
- Radio Paging
- **Microwave Relay Systems**
- Satellite Communications
- Bluetooth
- WLANs
- Cellular Communications

Microwave Relay Systems



Microwave Relay Systems (2)



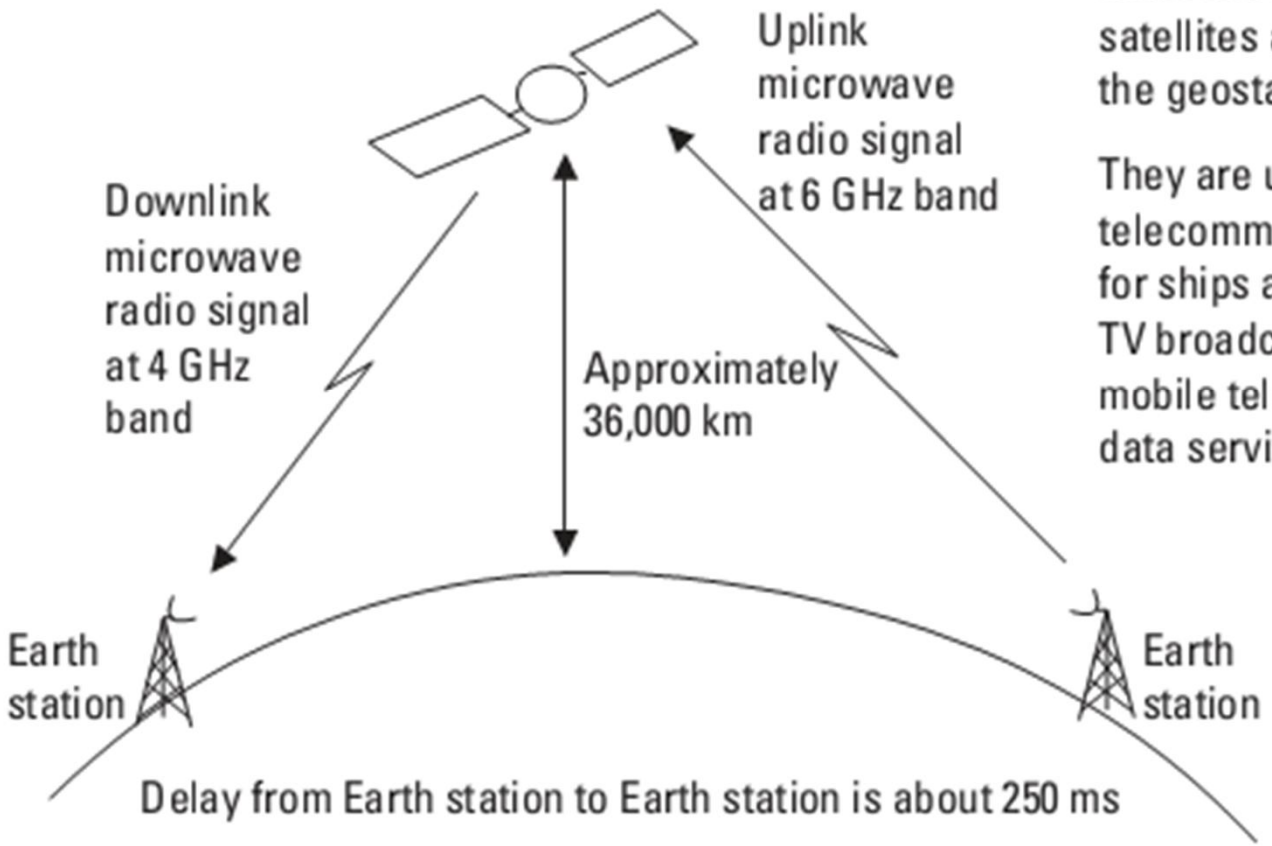
Wireless Communications

- Introductions
- Cordless Telephones
- PMR (Professional or Private Mobile Radio)
- Radio Paging
- Microwave Relay Systems
- **Satellite Communications**
- Bluetooth
- WLANs
- Cellular Communica-tions

Sistem Komunikasi Satelit

- Pada dasarnya, aplikasi dari sistem komunikasi satelit adlh utk **komunikasi tetap *(fixed)* point-to-point**.
- Namun, satelit jg menyediakan layanan **komunikasi bergerak *(mobile)*** utk **kapal dan pesawat terbang**, sbg sistem komunikasi cadangan. Satelit yg digunakan utk layanan ini adlh satelit geostasioner pd ketinggian 36.000 km.
- Lalu, satelit jg menyediakan layanan **komunikasi bergerak *(mobile)*** utk ***handy mobile station (MS)***, menggunakan satelit-satelit yg berorbit pd ketinggian 700 – 10.000 km. Misalnya: Iridium dan Globalstar.

Satellites for Fixed Communications



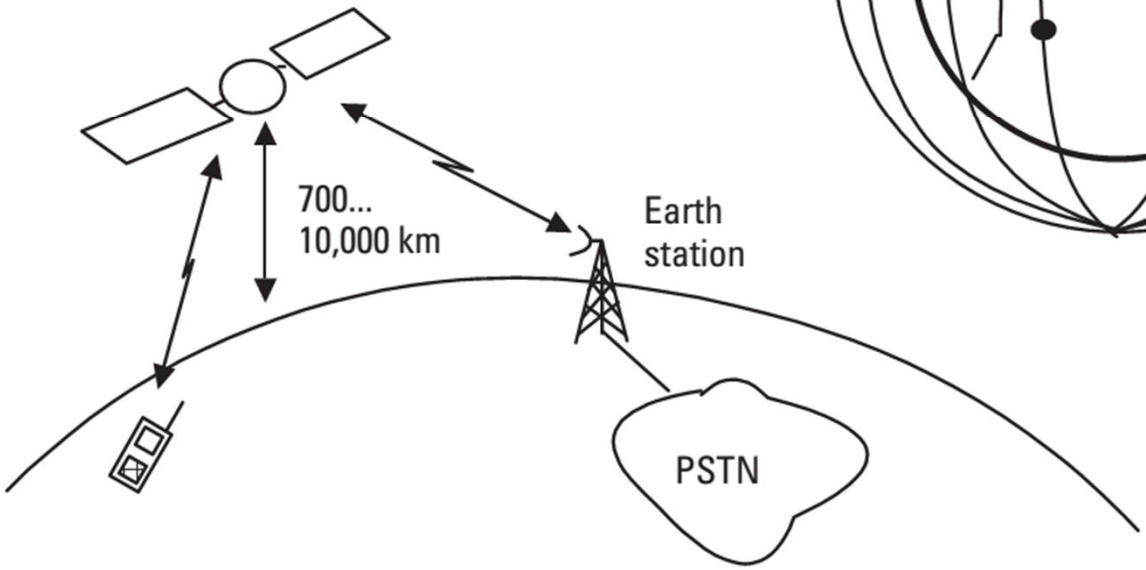
Most telecommunication satellites are placed in the geostationary orbit.

They are used to provide telecommunication services for ships and aircrafts, TV broadcasting, and mobile telephone and data services.

Satellites for Mobile Communications

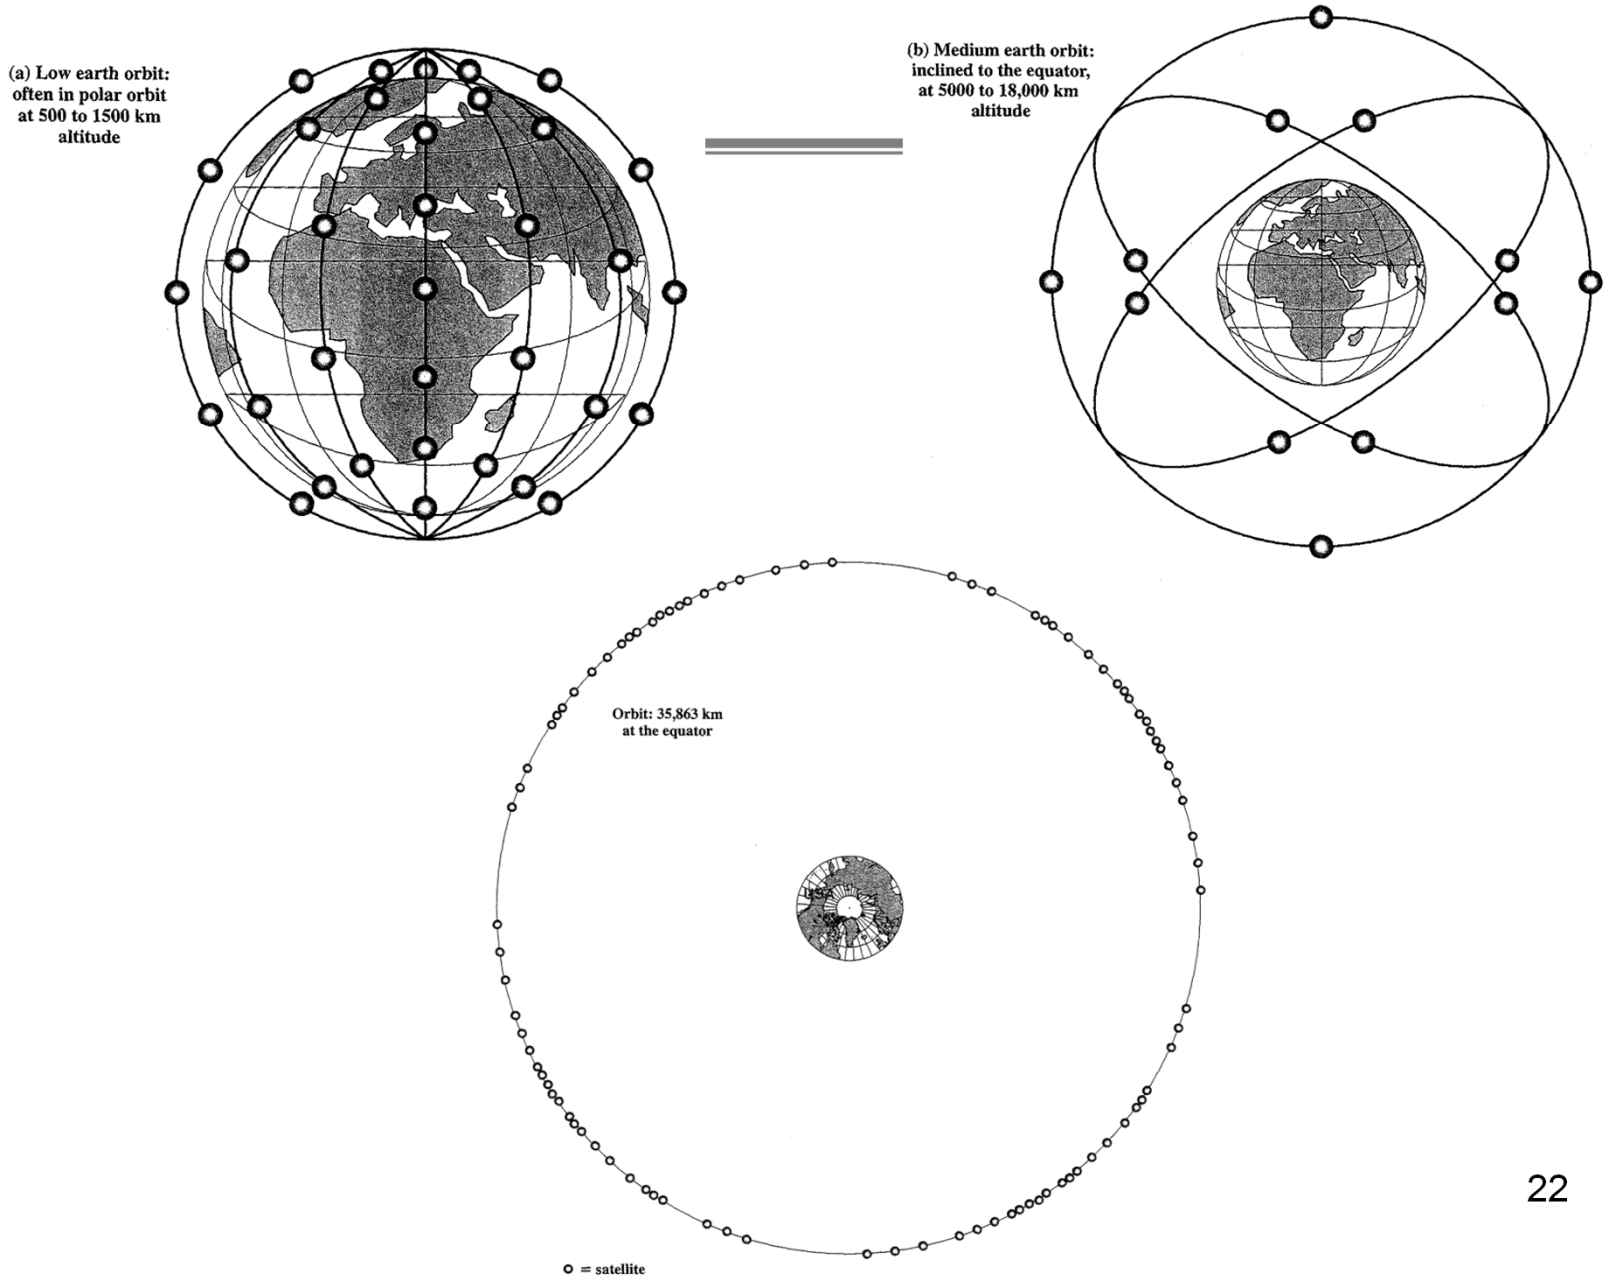
Mobile satellite systems use many low or medium orbit satellites that move around the Earth

Multimode terminals use satellite service if land mobile network is not available



A satellite that operates as a base station of a public land mobile network, PLMN.

Orbit Satelit: LEO, MEO, GEO



Aplikasi Satelit

Traditionally	-Weather satellites -Radio and TV broadcast satellites -Military satellites -Satellites for navigation and localization (e.g., GPS)
Telecommunication	-Global telephone connections -Backbone for global networks -Connections for communication in remote places or underdeveloped areas -Global mobile communication

Wireless Communications

- Introduction
- Cordless Telephones
- PMR (Professional/Private Mobile Radio)
- Radio Paging
- Microwave Relay Systems
- Satellite Communications
- **Bluetooth**
- WLAN
- Cellular Communications

Bluetooth

- **Bluetooth technology** allows for the replacement of proprietary cables that connect one digital device to another with a universal short-haul radio link.
- Bluetooth was **developed by** the Bluetooth Special Interest Group (SIG, http://www.bluetooth.com), founded by Ericsson, IBM, Intel, Nokia, and Toshiba.
- A small wireless Bluetooth network connecting, for example, a user's computer to its peripherals is called a **personal area network (PAN).** PAN contains one or more piconets. One Bluetooth **piconet** contains a single master and up to seven active slaves.
- Mobile computers, cellular handsets, printers, keyboards, and many other devices **can be embedded** with Bluetooth radios.
- Bluetooth systems use the same **2.4-GHz license free frequency band** as WLANs and they can coexist in the same area.
- Bluetooth uses **frequency hopping spread-spectrum (FHSS)** technology. There are 79 carrier frequencies with 1-MHz spacing over which the transmission frequency hops. Each piconet uses a different pseudorandom hopping sequence over the 79 carriers.
- **The modulation rate of Bluetooth is 1 Mbps.**

Wireless Communications

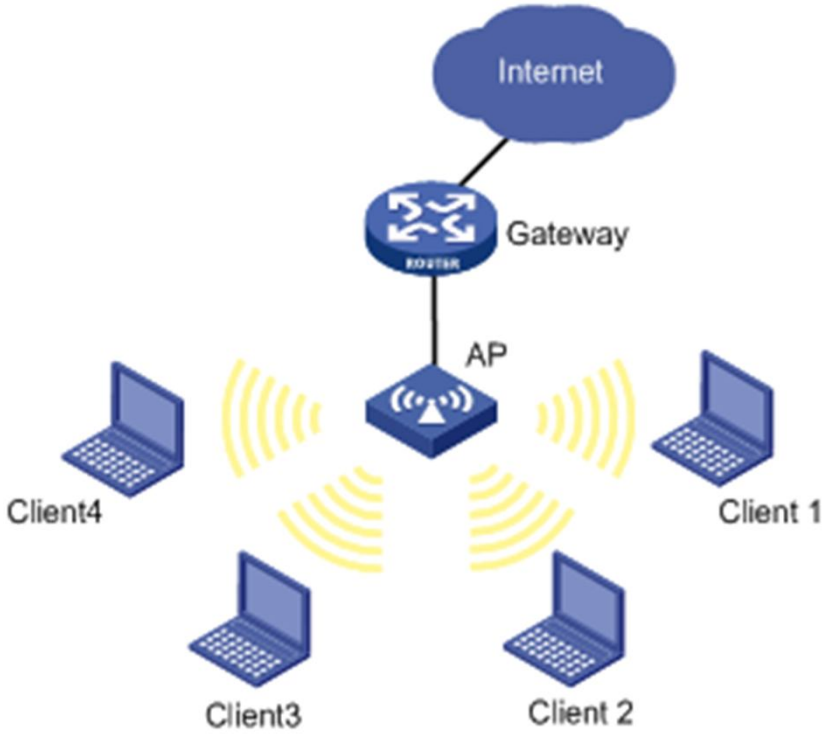
- Intorduction
- Cordless Telephones
- PMR (Professional/Private Mobile Radio)
- Microwave Relay Systems
- Radio Paging
- Satellite Communications
- Bluetooth
- **WLAN (Wireless Local Area Network)**
- Cellular Communications

WLAN

(Wireless Local Area Network)

- **WLAN** berasal dari **jaringan komputer berbasis IP (*internet protocol*).**
- Standar WLAN adlh keluarga **standar IEEE 802.11**, yaitu: IEEE 802.11a, IEEE 802.11b, IEEE 802.11g, IEEE 802.11n, dll.
- Pita frekuensi yg digunakan adlh ***unlicense frequency band* 2.4 GHz dan 5 GHz**.
- Disebut jg dgn **WiFi** (Wireless Fidelity).

WLAN (lanjutan)



Spesifikasi Wi-Fi

Spesifikasi	Kecepatan	Frekuensi Band	Cocok dengan
802.11b	11 Mb/s	~2.4 GHz	b
802.11a	54 Mb/s	~5 GHz	a
802.11g	54 Mb/s	~2.4 GHz	b, g
802.11n	100 Mb/s	~2.4 GHz	b, g, n

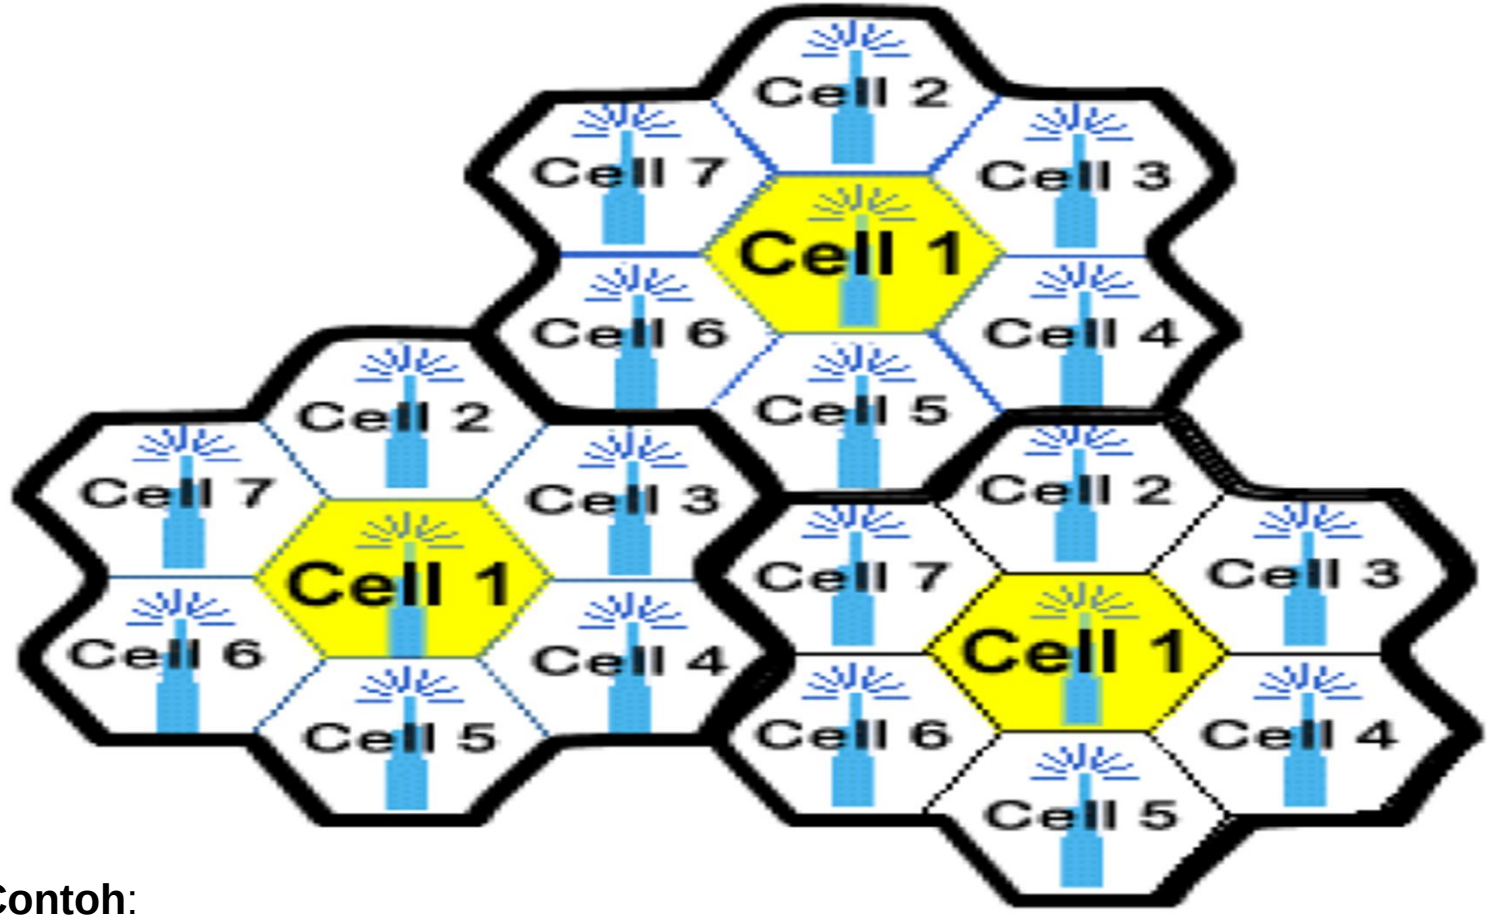
Sistem Komunikasi Seluler

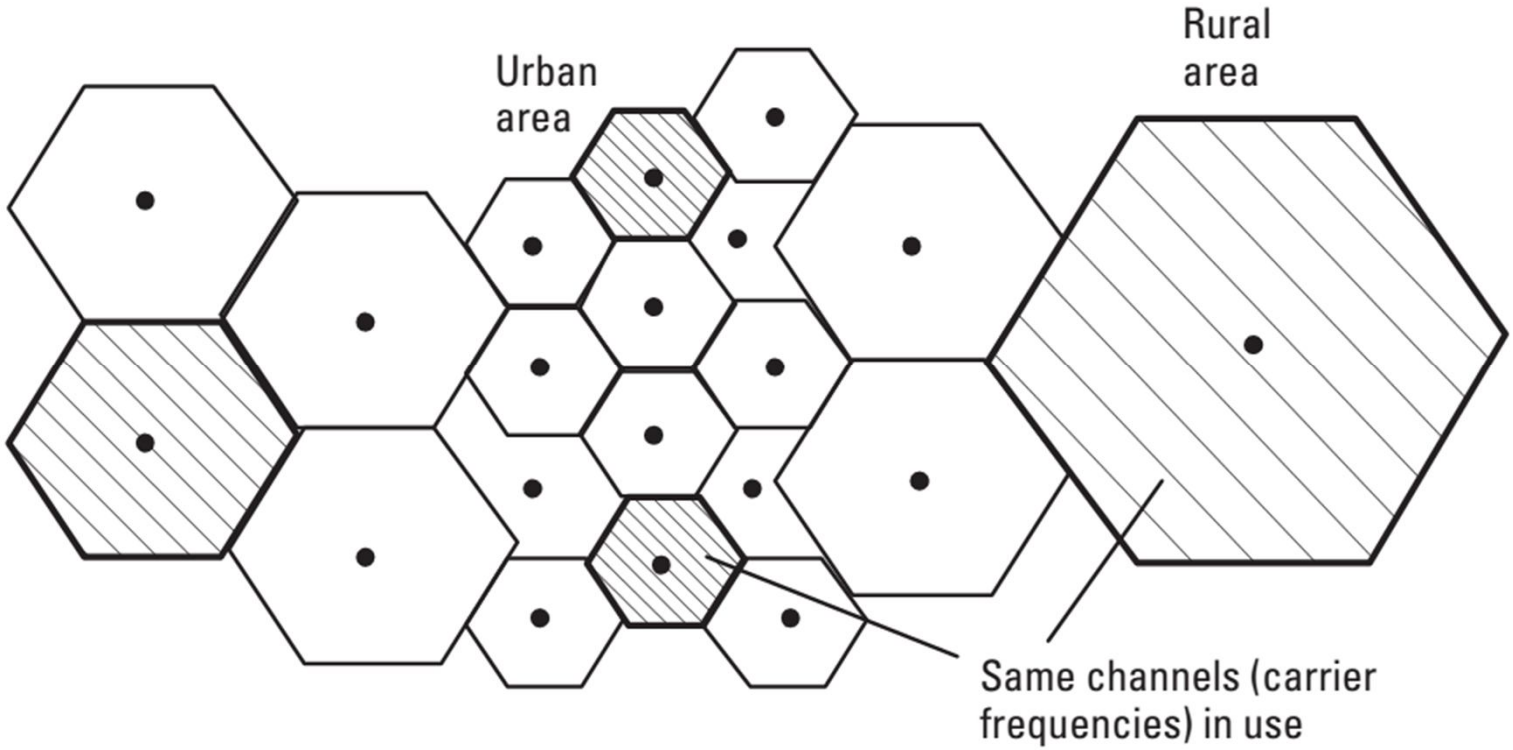
- **Masalah utama** pd jaringan komunikasi bergerak tradisional adlh **rendah kapasitas** akibat **terbatasnya pita frekuensi**.
- **Jaringan selular** menyediakan solusi dgn adanya **penggunaan ulang frekuensi yg sama** pd beberapa area (sel) yg berbeda dlm jaringan (dikenal dgn ***frequency reuse***).
- Mekanisme kunci lainnya adlh ***handoff*** atau ***handover*** yg memungkinkan komunikasi tdk terputus saat pengguna bergerak menuju sel (area) lain dlm jaringan.

Struktrur Sel dan *Frequency Reuse*

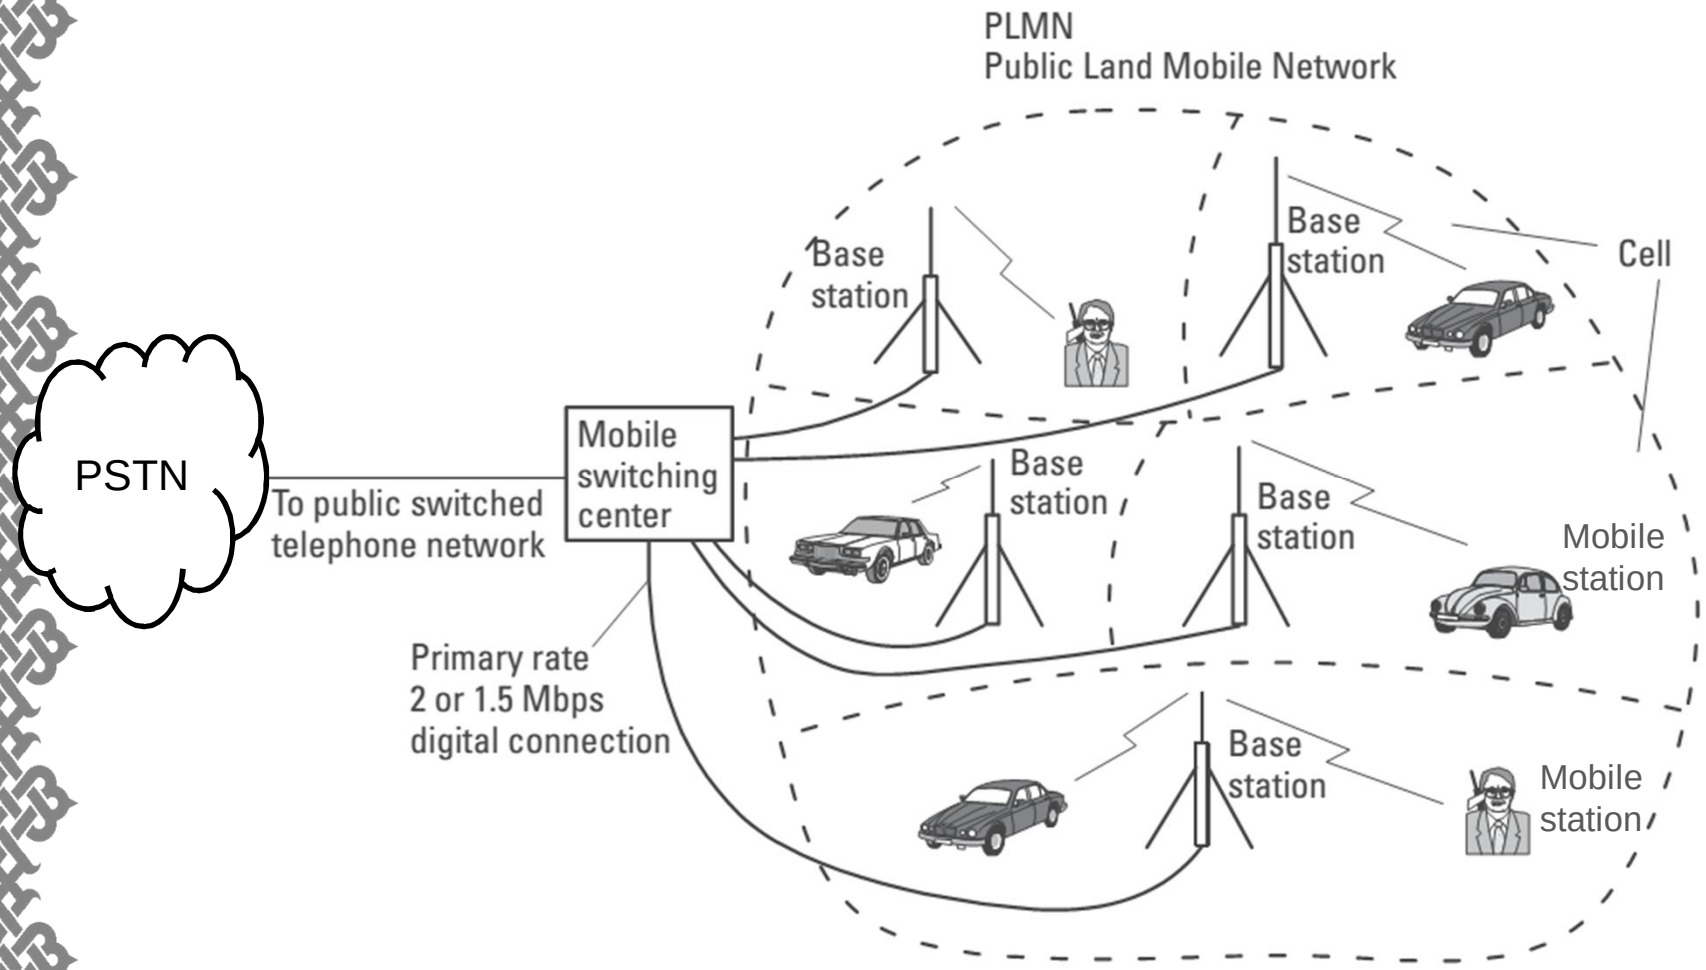


Contoh:
Misalkan suatu daerah (kota) dibagi-bagi menjadi 21 sel yg dikelompokkan ke dlm 3 *cluster*. Dgn demikian, setiap cluster terdiri dari 7 sel.

Struktrur Sel dan *Frequency Reuse* (2)



Struktur Dasar
Sistem Komunikasi Seluler



Elemen-elemen dasar pd jaringan seluler

- **Base tranceiver station (BTS)** atau terkadang disebut **base station (BS)** saja. → transceiver = transmitter/receiver.
- **Mobile station (MS)**, misalnya pesawat telepon bergerak.
- **Mobile switching center (MSC)**, yang bertindak seperti sentral lokal pd jaringan tetap (PSTN).
- Jaringan seluler dirancang utk jaringan akses, karena itu tdk memiliki hirarki swicthing dan untuk sambungan jarak jauh dan internasional menggunakan jaringan tetap *(fixed network)* sbg penghubung.

Karakteristik penting dari sistem seluler

- **Frequency reuse** provides a much larger number of communication channels than the number of channels allocated to the system.
- Automatic intercellular transfer, or a **handover** (or **handoff**), ensures continuity of communication when there is a need to change BSs.
- **Continuous monitoring** of communication between the MS and BS verifies the quality and detects the need for a cell transfer.
- **Automatic location** of mobile stations (MS) within the network ensures that calls can be routed to mobiles.
- Mobile stations **continuously listen** to a common channel of the network in order to receive a call.

Karakteristik penting dari sistem seluler (2)

- **Area** pd jaringan seluler dibagi menjadi beberapa **sel**.
- **Luas sel** diatur dgn mengatur daya pancar BTS (BS). Daya BS dan MS berkurang dgn berkurangnya ukuran sel.
- **Daya transmisi** BS dan MS dikontrol agar sekecil mungkin, utk mencegah interferensi pd sel lain yg menggunakan frekuensi yg sama ***(reuse of frequency)***.
- Dgn adanya *frequency reuse,* operator dpt menambah **kapasitas jaringan** dgn cara memperkecil ukuran sel.
- Adanya ***power control*** utk memperoleh ***low transmission power*** shg menjadikan masa operasi baterai lbh lama dan pelanggan lbh aman.
- Database: ***home location register*** **(HLR)** dan ***visitor location register*** **(VLR)**.

HLR dan VLR

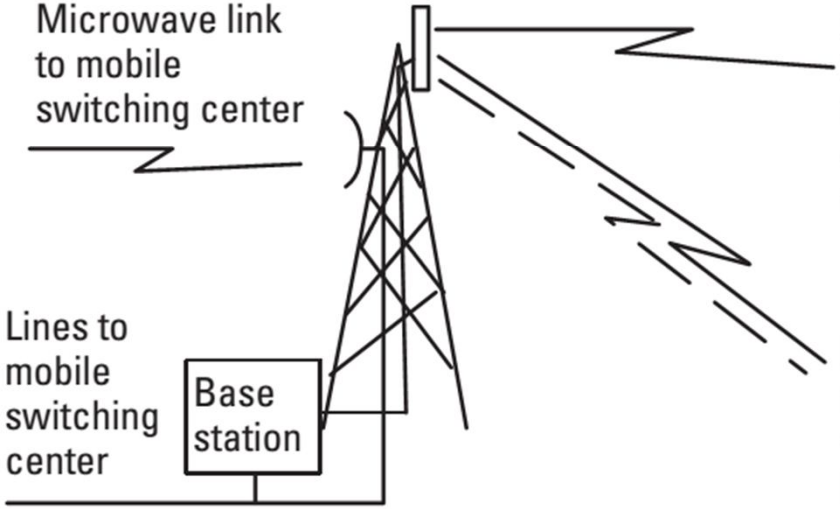
- Setiap pelanggan didaftarkan pd suatu HLR oleh operator-nya.
- **HLR** menyimpan informasi ttg seluruh pelanggan yg terdaftar pd-nya, misalnya: dimana lokasinya saat ini, layanan apa digunakan, ke nomor nama panggilan harus ditransfer.
- **VLR** menyimpan informasi ttg seluruh pelanggan yg berada dlm area-nya.
- VLR biasanya terpadu dlm MSC, tp HLR biasanya terpisah secara fisik.

Kanal radio pd jaringan seluler

- **Duplexing:**
  - ***Downlink*** atau ***forward link*** adlh kanal transmisi dari jaringan (BTS) ke MS.
  - ***Uplink*** atau ***reverse link*** adlh kanal transmisi dari MS ke BTS.
  - Pilihan *duplexing*: FDD dan TDD
- **Kanal kendali dan kanal trafik:**
  - Kanal kontrol ***(control channel)*** utk signalling dan kebutuhan kontrol lainnya.
  - Kanal trafik ***(traffic channel)*** utk mengalirkan trafik (suara atau data)

Jenis-jenis kanal radio pd sistem komunikasi seluler

HLR, home location register, stores subscriber information and updated location information (VLR address). Each subscriber is registered in one fixed HLR.
VLR, visitors location register, stores subscriber information of each MS located in its area.



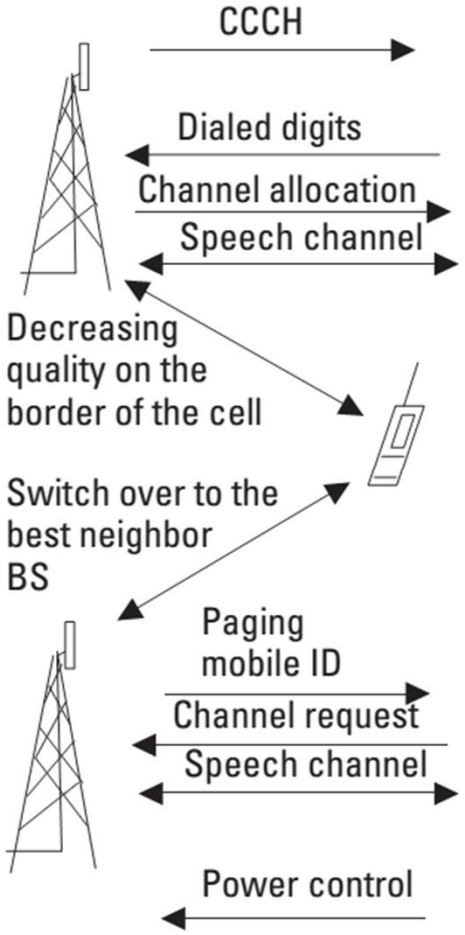
Common control channel that all mobiles listen to when they are in idle mode. Call request messages are sent on this channel in the case of an outgoing call and paging messages are sent in the case of an incoming call.

Dedicated channels that are used for calls (speech or traffic channels) when a mobile is in dedicated mode. Each dedicated channel has its own control channel for performance monitoring and control.

Prinsip kerja (operasi dasar) jaringan seluler

- Setiap MS mendapat identifikasi (identitas), berupa nomor telepon atau kode lain.
- Beberapa modus operasi:
  - MS in idle mode
  - Outgoing call
  - Incoming call
  - Handover (handoff)
  - MS transmitting power

Operasi dasar pd jaringan seluler



In idle mode the mobile station listens to the common control channel, CCCH.

Outgoing call: The dialed digits are sent to the network and a voice channel is allocated.

Handover: When the MS moves towards the edge of the base station area, communication quality is decreased. A new cell is selected with the help of measuring results of the neighbor cells. A new channel is then allocated and BS and MS switch to it at the same time.

Incoming call: Paging message is sent over the common control channel. When MS receives its own identification, it requests a traffic or voice channel, which is then allocated.

Transmission power is controlled to be as low as possible to minimize interference with other cells.

Generasi Jaringan Seluler

Generation	Name	Features
1 (1980)	NMT (*Nordic Mobile Telephone*), …	Analog Voice
2 (1992)	GSM (*Global System for Mobile communications*) - GSM 900, GSM 1800 IS95 (*Interim Standard*) based on CDMA - IS95a,b …cdmaOne	Digital Voice + data
2,5 (1999)	GPRS (*General Packet Radio Service*) EGPRS/EDGE (*Enhanced GPRS/Enhanced Data rates for Global Evolution*)	
3 (2001)	WCDMA/UMTS (*Universal Mobile Telecommunication System*) cdma2000 (*code division multiple access*)	Multimedia
4 (2011)	LTE/LTE-A (*Long Term Evolution – Advanced*), WiMAX IEEE802.16	OFDMA, high speed data, full mobility, and convergence
5 (2020)..?	…… ?

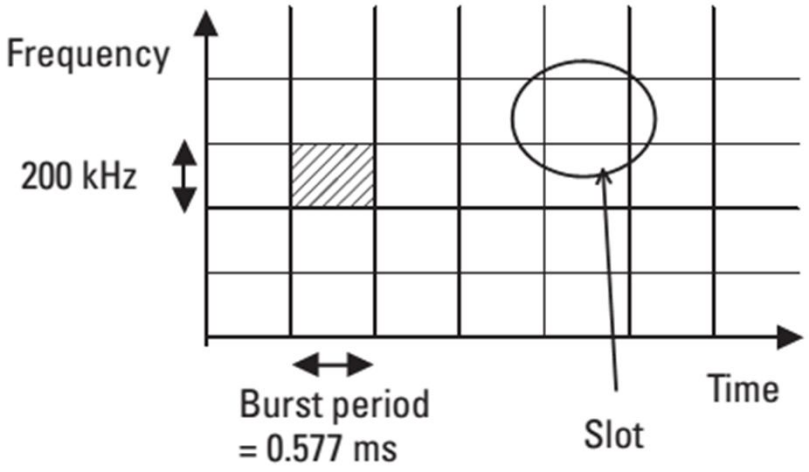
Characteristics of TDMA-Based Digital Cellular Systems

Table 4.6 Characteristics of TDMA-Based Digital Cellular Systems

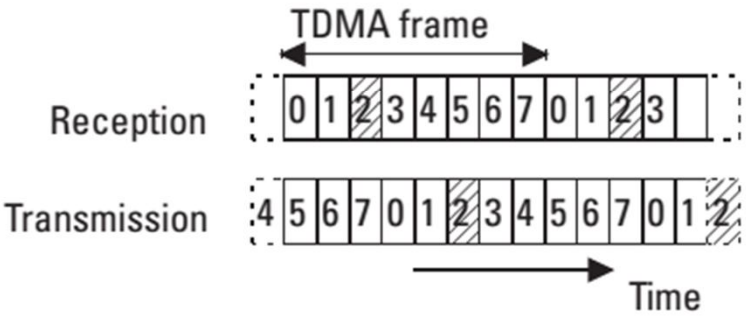
Standard	*Mobile Tx/Base Tx (MHz)*	*Access Method*	*Carrier Spacing (kHz)*	*Modulation*	*Channel Bit Rate kbit/s*	*Full-Rate Speech Coding kbit/s*	*Channels per Carrier (fr/hr)*
IS-54 (D-AMPS)	824–849/ 869–894	FDMA/TDMA/ FDD	30	$\pi/4$- differential quadrature phase shift keying (DQPSK)	48.6	7.95 (13 w/FEC)	3 /6
PDC	810–915/ 940–960	FDMA/TDMA/ FDD	25	$\pi/4$-DQPSK	42.0	6.7 (11.2 w/FEC)	3/6
GSM	890–915/ 935–960	FDMA/TDMA/ FDD	200	GMSK	270.8	13 (22.8 w/FEC)	8/16

Multiple-Access pada GSM: TDMA-FDMA

A transmission burst occupies a window in time and frequency called a slot.
There are eight time slots on each carrier frequency.
Eight simultaneous calls may use the same frequency.



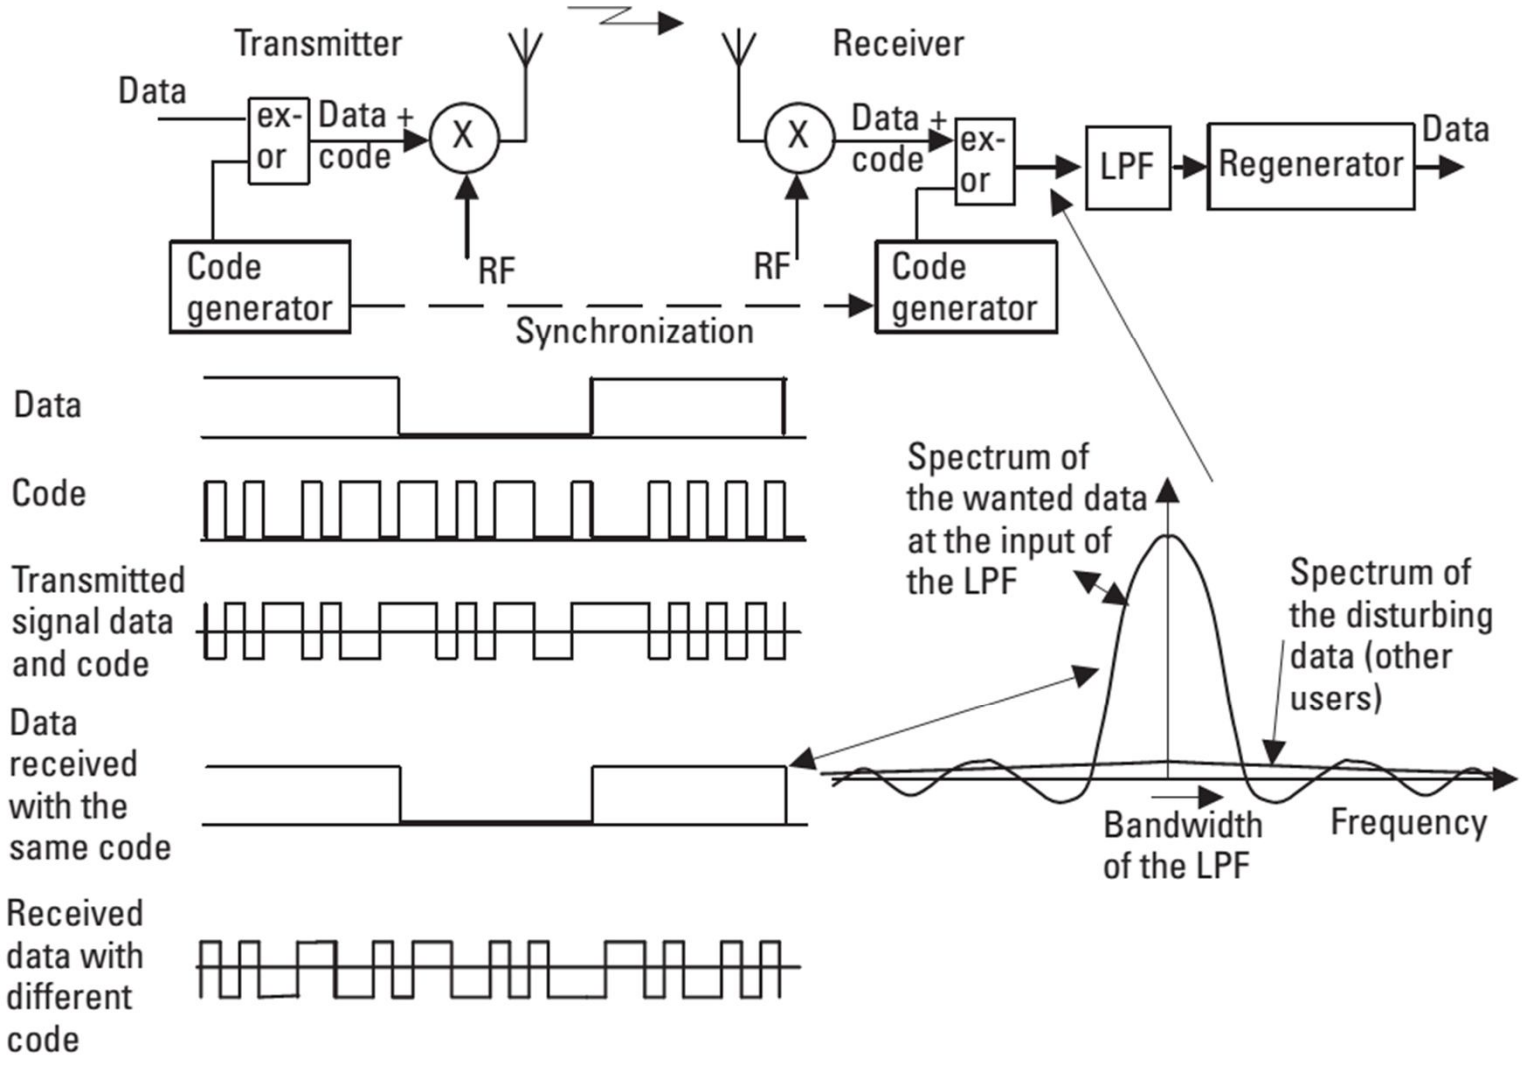
Emission of a mobile station takes place 3 burst periods later than reception.



Bidirectional radio transmission has fixed duplex distance:
45 MHz (900 MHz band) and
95 MHz (1,800 MHz band).

A mobile station receives, shifts the frequency by 45 or 95 MHz, and emits a moment later.

Multiple-Access pada IS-95: CDMA



Pita Frekuensi yg Digunakan pd (beberapa) 1G dan 2G

Table 1.10: ▶
Frequency Range Used in Different Systems (an Example)

Systems	BS Transmitting Range/MS Receiving Range	BS Receiving Range/MS Transmitting Range	RF Channel
FDMA (AMPS)	870–890 MHz	825–845 MHz	0.03 MHz
TDMA (GSM 900)	935–960 MHz	890–915 MHz	0.20 MHz
TDMA (GSM 1800)	1805–1880 MHz	1710–1785 MHz	0.20 MHz

PR-9

- Soal-soal PR-9 ada di file tersendiri.

Spirit Minggu Ini

- *“Dan orang-orang yang bersungguh-sungguh di jalan Kami niscaya Kami akan tunjukkan kepadanya jalan-jalan Kami. Sesungguhnya Allah bersama orang-orang yang berbuat baik.”*
  (Q.S. Al Ankabut [29] : 69)

Sekian, terima kasih, semoga berkah.

Ada pertanyaan?

PR-9

TEE 843 – Sistem Telekomunikasi

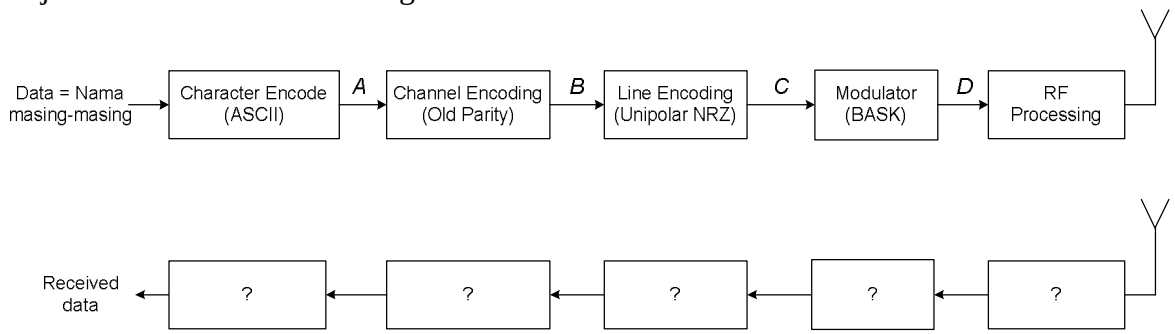
1). Jelaskan pengertian komunikasi nirkabel (*wireless communications*) dan komunikasi bergerak (*mobile communications*)! Uraikan perbedaan antar keduanya, jika ada!

2). *What are the main advantages of cellular systems compared with the old generation radio telephone systems that did not utilize a cellular network structure?*

3). *An analog radio telephone network has a frequency band of 180 (bidirectional) FDMA channels. The network covers a 50 × 50–km urban area. Give the maximum number of simultaneous calls in the network if (a) only one base station is in use; (b) the network is upgraded to a cellular network with a cell size of 10×10 km and the frequency reuse ratio is 1:9 (each channel is used again in every ninth cell); (c) cell size is reduced to 1×1 km; and (d) cell size is reduced further to 0.35×0.35 km (that is, equal to the minimum size of cells in early GSM). For simplicity, assume here that the cells are rectangular and all channels are used as traffic channels. [Hint: Divide all channels of the network between a cell cluster (group) of nine cells. Then repeat this cluster to cover the geographical area of the network.]*

4). Jelaskan perkembangan sistem komunikasi seluler mulai dari generasi pertama (1G) sampai dengan generasi keempat (4G)! Uraian minimal harus mencakup teknologi, layanan, dan standar masing-masing generasi. Lengkapi dengan gambar jika diperlukan!

5). Tinjaulah sistem komunikasi digital nirkabel berikut ini:



(i). Isilah nama blok-blok yg masih kosong
(ii). Carilah deretan bit pada *A*
(iii). Carilah deretan bit pada *B*
(iv). Gambarkan bentuk sinyal pada *C* khusus utk 16 bit pertama.
(v). Gambarkan bentuk sinyal pada *D* khusus utk 16 bit pertama apabila sinyal *carrier* adalah $c(t) = \sin 2\pi f_c t$ untuk $f_c = 3/T_b$, dimana f_c adalah frekuensi carrier dan T_b adalah durasi bit.
(vi). Jika pada *RF processing*, sinyal di-*upconvert* ke frekuensi 4 GHz lalu dipancarkan dgn daya 2 watt, penguatan antena pengirim 30 dB, penguatan antena penerima 20 dB, berapa daya sinyal terima pd jarak 16 km dengan asumsi bahwa sinyal hanya mengalami *free-space pathloss*?

"Selamat mengerjakan, semoga sukses dan berkah."
